

AMENDMENTS TO THE ABSTRACT

Please delete the current Abstract and replace it in its entirety with the paragraph that follows:

A remote control system is provided that prevents a combination of a transmitter and a movable machine, other than a combination determined in the system, from being established; ensures fair fighting games, and is capable of easily discriminating a movable machine and a transmitter combined in the system even when combinations cannot be discriminated visibly. A transmitter reads characteristic information from a recording medium having the characteristic information associated with a movable machine recorded thereon, and transmits the information to the movable machine as initial data. If the received characteristic information coincides with characteristic information which the movable machine has, then the movable machine is ready to operate. The movable machine is not activated until the initial data containing the characteristic information is received.
